MODULE NAME:	MODULE CODE:
CLOUD DEVELOPMENT A	CLDV7111/w

ASSESSMENT TYPE: POE (PAPER AND MARKING RUBRIC)

TOTAL MARK ALLOCATION: 300 MARKS

TOTAL HOURS: A MINIMUM OF 35 HOURS IS SUGGESTED TO COMPLETE THIS ASSESSMENT

By submitting this assessment, you acknowledge that you have read and understood all the rules as per the terms in the registration contract, in particular the assignment and assessment rules in The IIE Assessment Strategy and Policy (IIE009), the intellectual integrity and plagiarism rules in the Intellectual Integrity and Property Rights Policy (IIE023), as well as any rules and regulations published in the student portal.

INSTRUCTIONS:

1. ***No material may be copied from original sources, even if referenced correctly, unless it is a direct quote indicated with quotation marks. No more than 10% of the assignment may consist of direct quotes.***
2. ***Make a copy of your POE before handing it in.***
3. *Assessments must be typed unless otherwise specified.*
4. ***Begin each section on a new page.***
5. *Follow all instructions on the PoE cover sheet.*
6. *This is an individual assessment.*
7. *Answer All Questions.*
8. *Instructions for submitting your assessment:*
    a. *Use of good programming practice and comments in code is compulsory.*
    b. *Save your solution/project files in your GitHub repository for this module.*
    c. *Save all files (including any source code files, template files, design files, image files, text files, database files, etc.) within your GitHub repository.*
    d. *Do NOT save zipped (archive) files in your GitHub repository unless specifically instructed to do so.*
    e. ***Important:*** *Upon completion of your assessment, you must save and close all your open files before submitting your work. You will submit your assessment on the LMS page for this module.*
    f. ***To complete your submission:*** *Create a document in MS Word or Notepad for each part of the POE. The document name for each part of the POE must follow the format explained in the POE instructions.*
    g. *In this document, include the following: Your student number, the module code, all required answers,* ***the link to your GitHub repository*** *where you saved your practical work, and the URL of your web application.*
    h. *Submit this document in the LMS, using the submission links for this module.*

© The Independent Institute of Education (Pty) Ltd 2026

Referencing Rubric

Providing evidence based on valid and referenced academic sources is a fundamental educational principle and the cornerstone of high-quality academic work. Part of achieving this quality is referencing in a way that is consistent and congruent with the requirements of the referencing style being used.

Therefore, inconsistent and/or incongruent referencing will result in a penalty of **a maximum of ten percent being deducted from the overall percentage** awarded to your assessment submission.

Please note that **evidence of plagiarism** in the form of copied or unreferenced work, absent reference lists, or exceptionally poor referencing **may result in action being taken in accordance with The IIE's Intellectual Integrity and Property Rights Policy (IIE023)**. Similarly, **evidence of excessive AI usage may result in action being taken in accordance with The IIE's Student Conduct, Discipline and Safety Policy (IIE015)**.

Markers are required to provide feedback to students by **circling/underlining the information in the table below that best describes the student's work and by adding constructive commentary where appropriate.** The examples provided are not exhaustive but illustrate the errors.

Deductions

- Where the student's work contains **five or more errors** aligned to the **minor errors column** below, **deduct 5% from the overall percentage.**
- Where the student's work contains **five or more errors** aligned to the **major errors column** below, **deduct 10% from the overall percentage.**
- **Where both minor and major errors** (e.g. two minor and three major, etc.) are present, **deduct 10% only** (and not 5% or 15%) from the overall percentage.

Required: **Consistent and congruent referencing**	**Minor errors** **Deduct 5% from overall percentage.** **Example: if the response receives 70%, deduct 5%. The final mark is 65%.**	**Major errors** **Deduct 10% from the overall percentage.** **Example: if the response receives 70%, deduct 10%. The final mark is 60%.**
Consistency • The **correct referencing style** for the **discipline** – i.e., either **Harvard**, OR **APA** (for Psychology), OR **Law**, OR **IEEE** (for ICT/Engineering) – has been used consistently for all in-text references and in the bibliography/reference list. • **Concepts** and **ideas** that are **quoted** and/or **paraphrased** are referenced consistently throughout. • **Position of the in-text reference**: an in-text reference is positioned consistently where appropriate for every quote and paraphrase.	**Minor inconsistencies:** • The referencing style used is generally consistent with what is required, but there are one or two changes/errors in the format of in-text referencing and/or in the bibliography/reference list. • For example, page numbers for direct quotes in-text have been provided for one source, but not in another. Or, two book chapters in the bibliography/reference list have been referenced in two different formats. Or, the publication year has been placed after the author name in one bibliography/reference list entry, and after the source title in another, etc. • Concepts and ideas in quotes and/or paraphrases are typically referenced, but a full in-text reference is missing or incomplete from one or two small sections of the work. • Position of the references: in-text references are only given at the beginning and/or end of every paragraph.	**Major inconsistencies:** • Poor and wholly inconsistent referencing style used in-text and/or in the bibliography/reference list. • Multiple referencing styles for the same source types have been used. • For example, the format for direct quotes in-text and/or book chapters in the bibliography/reference list and/or year of publication in the bibliography/reference list is different across multiple instances. • Concepts and ideas in quotes and/or paraphrases are haphazardly referenced in-text. • Position of the references: in-text references are only given at the beginning or end of large sections of work.
Feedback on referencing consistency:		
Congruency • **Each source** reflected within **in-text references** is included accurately in the **bibliography/reference list.** • All **bibliography/reference list** entries are in the **required order** for the referencing style used (e.g. alphabetical, alphabetical under subheadings, numerical). • All **direct quotes** and **paraphrases** have been **integrated appropriately** into the text using introductory phrases, accurate grammar, etc.	**Minor incongruences:** • There is largely a match between the sources presented in-text and those in the bibliography/reference list, but one or two sources that appear in-text do not appear in the bibliography/reference list, or vice versa. Or key source information is missing from one or two in-text references or bibliography/reference list entries only (e.g. publication year, city of publication, URL date accessed, etc.). • There is a clear and largely accurate ordering of sources in the bibliography/reference list as required by the referencing style used, but with one or two references out of order. • An attempt has been made for source integration into the text using appropriate introductory phrases and grammar, but one or two quotes or paraphrases do not flow as clearly or logically within the sentence structure as they could.	**Major incongruences:** • No relationship/several incongruencies between the in-text referencing and the bibliography/reference list. • For example, multiple sources are included in-text, but not in the bibliography, and/or vice versa. Key source information is missing from multiple in-text references and/or reference list entries. A URL link, rather than the actual reference, is provided in the bibliography. Sources are repeated in the reference list, etc. • Most sources are listed in a haphazard order throughout the bibliography/reference list. • Few to no appropriate introductory phrases or rules of grammar have been applied, and many direct quotes and/or paraphrases feel disconnected from the flow of the text.
Feedback on referencing congruency:		
Overall feedback on referencing, with suggested improvements:		

© The Independent Institute of Education (Pty) Ltd 2026

Background

EventEase, an up-and-coming event management company, coordinates a variety of events across different venues. Due to rapid growth and increasing demand, EventEase has been overwhelmed with managing multiple venue bookings, scheduling, and handling booking conflicts. Currently, all scheduling and bookings are managed manually, leading to double bookings, last-minute cancellations, and a lack of visibility into venue availability.

EventEase has contracted your development team to build an efficient, user-friendly online booking platform to streamline these processes. This application should simplify venue management, prevent booking conflicts, provide a clear view of scheduled events, and enable guests to book venues based on availability. The app should also offer search and filtering capabilities to make it easy to view and manage bookings.

The first phase of the project is building the admin platform, so customers will not be able to make bookings themselves. They can email, call, or walk in and request to make a booking, and from there, one of the booking specialists will use the system to make the booking for the customer. It is possible for an event to be loaded onto the system prior to a venue becoming available, so that once the venue does become available, the booking can be made.

The CEO of EventEase has provided the following requirements that must be present for the new Venue Booking System:

- EventEase needs a user-friendly web application that allows the booking specialists to browse available venues, view events, and make or manage bookings.
- The system should allow authorised personnel to create, view, update, and delete venue and event information, with secure handling of image uploads for each venue.
- Prevent double bookings for venues and restrict deletion of venues or events associated with existing bookings.
- Ensure that all booking information is stored securely in the cloud, with backups.
- Some important information to be stored includes the locations, capacity, venue/event names, start and end dates, and unique booking IDs

EventEase envisions a future where this platform integrates with additional cloud services, allowing seamless scaling as their needs grow.

© The Independent Institute of Education (Pty) Ltd 2026

Introduction

You will build a Venue Booking System for EventEase using ASP.NET Core MVC, deployed in stages to the cloud. The application will follow three main development phases, each building upon the previous phase, to progressively introduce core functionalities and cloud services.

Development Phases:

Part 1: Project Foundation and Initial Deployment

1. Database Design:
    - Develop an Entity-Relationship Diagram (ERD) that includes the following tables:
        - **Venue**: Contains details such as VenueId, VenueName, Location, Capacity, and ImageUrl.
        - **Event**: Contains event-specific data, including EventId, EventName, EventDate, Description, and VenueId.
        - **Booking**: An associative table linking Venue and Event (containing BookingID, EventID, VenueId, BookingDate)
    - You may add additional tables, but keep the structure simple, ensuring it covers the base requirements without overcomplicating the schema.
2. Initial Application Development:
    - Create an ASP.NET Core MVC project with models for Venues, Events, and Bookings.
    - Build the application with necessary controllers, views, and initial CRUD functionality to the database.
    - For images, use placeholder URLs (links to sample images) for venues and events in this phase.
3. Deploy Initial Version to Azure:
    - Deploy the web app to Azure using the Azure Web App Service.
    - Set up an Azure SQL Database to store venue, event, and booking information and migrate your local data to your Azure SQL Database.

© The Independent Institute of Education (Pty) Ltd 2026

Part 2: Enhancing Functionality and Integrating Cloud Storage

1. Error Handling and Validation:
    - Implement validation rules to prevent double bookings for the same venue on the same date.
    - Add logic to restrict the deletion of venues or events associated with active bookings, displaying an alert to the booking specialist if an action would affect existing bookings.
2. Image Management with Azure Blob Storage:
    - Replace placeholder URLs with image upload functionality, storing images securely in Azure Blob Storage for Venues and Events.
3. Enhanced Display and Search:
    - Develop a consolidated view to display bookings more effectively.
    - Add a search feature to browse venues, events, and bookings by various criteria.
4. Azure Deployment Updates:
    - Deploy the updated web application with blob storage integration.

Part 3: Advanced Filtering, Reporting, and Documentation

1. Filtering and Event Type Integration:
    - Add a new **EventType** lookup table with predefined categories (e.g., Conference, Wedding, Concert, etc.) to classify events.
    - Enhance the search functionality to filter results by event type, venue, date range, and availability.
2. Final Deployment and Reflective Report Write-Up:
    - Ensure that the fully updated application is deployed to Azure with all the functionality from Parts 1 and 2 and that students understand how the app components interact with Azure services.
    - For the final assessment, you will submit a report reflecting on your experience while building the EventEase system using a host of Azure-based services and tools. In this report, you will explain how each service contributed to the app's functionality and performance.

By the end of this project

EventEase should have a fully functional Venue Booking System with essential features, from event, venue, and booking management to cloud-stored images and filtering capabilities. This project is going to prepare you for more complex projects based on cloud-based systems.

© The Independent Institute of Education (Pty) Ltd 2026

Instructions

This **Portfolio of Evidence (POE)** requires you to create the Web Application, Database Storage, Azure Compute, and Azure Data Storage components for EventEase, progressively developed through Part 1, Part 2, and culminating in the final POE solution.

To work on the POE, students are required to:

Have access to an Azure account with available credit. Your lecturer/campus will arrange this access at the start of this module.

Use Microsoft Visual Studio for your coding.

Save the source code in a GitHub repository. Your lecturer/campus will arrange this access at the start of the module.

The submission of each part of the POE will require you to do the following:

- Create a **document** in MS Word which contains the following:
- Your ST number.
- The module code
- **The URL to your GitHub repository source code**
- **All relevant URLs required, especially the URL of the deployed Web App**
- All answers required, including typed answers, diagrams, and screenshots
- The document name must follow the format shown here:
  StudentNumber_ModuleCode_Part#.
  - E.g., if your student number is *12345* and you are submitting *Part 1* of the POE for the module *CLDV7111*, create a document named ***12345_CLDV7111_Part1, and subsequently a folder called 12345_CLDV7111_Part1***
- Submit this document on Arc, using the submission link on the Arc page for this module.

© The Independent Institute of Education (Pty) Ltd 2026

Part 1 — Project Foundation and Initial Deployment (Marks: 100)

Related Content: Learning Units: 1-2

At the end of this specific part, students should be able to:

Practically

- *Design and create a Basic Database Structure.*
- *Implement ASP.NET Core MVC Basics.*
- *Integrate Azure SQL Database with ASP.NET Core.*
- *Deploy an ASP.NET Core web application to Azure.*

Theoretically

- *Explain the difference between deploying on-premises and in the cloud.*
- *Identify key differences between Azure hosting models.*

A. Design the EventEase Database

Based on the background information provided earlier, develop an **Entity-Relationship-Diagram** with an accompanying **Database Script** that will hold the data to be captured into the EventEase system. Your database should contain three main **tables** for now, based on the CEO's requirements in the background provided above.

B. Develop the Web Application

Build an ASP.NET Core web application with corresponding models, controllers, and views for the EventEase system.

Your web application should include the following:

- The relevant Models, Controllers, and Views for each of the Venues, Events, and Bookings.
- Your application should communicate with your database, implementing CRUD functionality.
- For the images, use placeholder URLs (links to sample images) for venues and events in this phase.

© The Independent Institute of Education (Pty) Ltd 2026

C. Deploy your Web app and Database to Microsoft Azure:

- Set up an Azure web app service and deploy your web app to this service.
- Set up an Azure SQL Database and migrate your local data to the database service.

D. Cloud Computing Basics

1. In what ways does deploying an application in the cloud differ from deploying it on premises, particularly regarding security, deployment speed, and resource management? Use examples to illustrate your points.
2. What are the key differences between Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS), and why might EventEase benefit from the use of PaaS over the other two when building a new application? Use examples to support your answer.

Submission Notes

- Ensure all the relevant material is present in your submission, i.e., your locally developed web app, ERD, Database Script, Word document, etc.
- Do not forget to provide any relevant URLs, such as the web app URL.
- Remember that this submission must include code attribution and traditional referencing, as it includes both practical and theoretical content.

[TOTAL MARKS: 100]

© The Independent Institute of Education (Pty) Ltd 2026

Part 2 — Enhancing Functionality and Integrating Cloud Storage (Marks: 100)

Related Content: Learning Units: 3-6

At the end of this specific part, students should be able to:

Practically

- *Implement Error Handling and Validation*
- *Manage Images with Azure Blob Storage*
- *Enhancing Application Interface and Display*
- *Implement a Basic Search Functionality*
- *Publish Updated Application and Services to Azure*

Theoretically

- *Explain how Azure Cognitive Search differs from traditional search engines.*
- *Discuss the importance of normalization in cloud-based database design.*
- *Compare the differences between relational and NoSQL cloud-based databases.*
- *Discuss how Durable functions can benefit a cloud application's performance.*

A. Integrate Azure Storage

In part 1, your event and venue images were being saved as simple URLs to the database. This is not sustainable long term; images need to be properly stored and managed, so for part 2, your images must now be stored in an Azure Storage Service.

B. Implementing Error Handling and Validation

We want to improve the User Experience by implementing validation rules and proper error handling to prevent common crash cases and user errors that may occur during the use of the system.

- Add validation to prevent the double booking of a venue for two different events on the same date and time.
- Add validation to restrict the deletion of venues or events associated with active bookings.
- Ensure the application does not crash on common user error actions, such as a user adding a new venue without a required field.
- Ensure to add a function that displays an alert to the user when a validation error occurs.

© The Independent Institute of Education (Pty) Ltd 2026

C. Enhanced Display and Search:

In part 1, your database included only three tables; to enhance the booking display, you will be required to incorporate a **view** that consolidates the relevant booking information to create a richer display for the booking specialists to manage the bookings.

- This view should include all the relevant information coming from the venue and event tables and provide relevant booking information.
- Add a simple search function to this new booking's view so the booking specialists can search for bookings via the BookingID, or Event Name.

D. Azure Deployment Updates:

- Deploy the updated web application with Azure storage and search integration.
- Update your database to include the newly created view.

E. Database Design, Cognitive Search

1. Explain how Azure's Cognitive Search differs from traditional search engines and discuss potential use cases where Cognitive Search would offer a clear advantage. What limitations does it have, and how can they be mitigated?
2. Why is database normalization important in cloud-based database design? Discuss the impact of both normalized and denormalized structures on performance and scalability in a cloud environment like Azure

Submission Notes

- Ensure all the relevant material is present in your submission.
- Do not forget to provide any relevant URLs, such as the web app URL.
- Remember that this submission must include code attribution and traditional referencing, as it includes both practical and theoretical content.

[TOTAL MARKS: 100]

© The Independent Institute of Education (Pty) Ltd 2026

Part 3 — Advanced Filtering, Reporting, and Documentation (Marks: 100)

Related Content: Learning Units: 7-9

At the end of this specific part, students should be able to:

Practically

- *Enhance Search with Filtering and Event Type Classification.*
- *Finalise Application Deployment and Documentation.*
- *Reflect on Project and Cloud Skills Developed.*

Theoretically

- *Discuss how Cosmos DB differs from traditional databases.*
- *Discuss key considerations when designing logic apps that handle sensitive data.*
- *Explain how combining Event Grid with other services can create robust workflows.*

A. Advanced Filtering

Let's now extend the search feature we implemented in part 2 to include filters to improve the search experience for the booking specialists:

- Add a new **EventType** lookup to your database with predefined categories and an availability field to your venue table.
- Implement filters to your search functionality to filter results by event type, date range, and venue availability.

B. Azure Deployment Updates:

- Deploy the updated web application with filter feature integration.
- Update your database to include the newly created table and field.

© The Independent Institute of Education (Pty) Ltd 2026

C. Reflective Technical Report

You will now write a reflective report documenting your development journey throughout this POE, summarising your experience with Azure Web App, SQL Database, and Azure Storage, explaining how each service contributed to your design, development, and architectural decisions when building the Event Ease application.

Your report must include the following:

- A detailed description of the application's full feature list.
- Component discussion:
  - Discuss which Azure services were used for each part of the project and why they were used. You may also include some potential alternatives to the tools you used that you feel could have better fit the implementation.
  - Discuss the technologies used to build the project and why they were used.
- Reflect on the entire project from Part 1 to now and discuss what you have come to understand and learnt in terms of designing, developing, and deploying cloud-based applications.

Submission Notes

- Ensure all the relevant material is present in your submission.
- Do not forget to provide any relevant URLs, such as the web app URL.
- Remember that this submission must include code attribution & traditional referencing as it includes both practical and theoretical content.

[TOTAL MARKS: 100]

Assessment Sheet (Marking Rubric)

Please note: Tear off this section and **attach** it to your work when you submit it/ If this is an online submission, then this information needs to be included in the online submission.

MODULE NAME:	**MODULE CODE:**
CLOUD DEVELOPMENT A	**CLDV7111/w**
STUDENT NAME:	
STUDENT NUMBER:	

Rubric 1 (for POE Part 1)					
You will be awarded marks based on how well and completely you implemented the following:	**Excellent**	**Good**	**Developing**	**Poor**	**Comments**
A. Database Design • ERD contains all the necessary entities, relationships, labels, attributes, and multiplicities. • Database script contains all the relevant scripts o Table creation o Table data insertion o Entity and Referential Integrity Added • ERD provided in submission • Database script provided in submission	**26-30**	**16-25**	**11-15**	**5-10**	

© The Independent Institute of Education (Pty) Ltd 2026

Rubric 1 (for POE Part 1)					
You will be awarded marks based on how well and completely you implemented the following:	**Excellent**	**Good**	**Developing**	**Poor**	**Comments**

B. Develop the web application
 	
• All the relevant Models, Views and Controllers are present as per requirements
  o Venue
  o Event
  o Booking
• CRUD functionality is implemented
  o Venue
  o Event
  o Booking
 	
• Images use placeholder URLs and are viewable in the application
 	
• ASP.NET Project provided in submission
	26-30	**16-25**	**11-15**	**5-10**	

C. Deploy your web app and Database to Microsoft Azure
 	
• Azure web app service is set in the Azure portal
  o Screenshot of the service created in the portal
  o Screenshot of successful deployment message in Visual Studio
• Azure SQL database is set up in the Azure portal
	16-20	**11-15**	**6-10**	**0-5**	

© The Independent Institute of Education (Pty) Ltd 2026

Rubric 1 (for POE Part 1)					
You will be awarded marks based on how well and completely you implemented the following:	**Excellent**	**Good**	**Developing**	**Poor**	**Comments**
o Screenshot of the service created in the Azure portal o Screenshot of migrated data and tables existing shown inside the query editor • Web app URL submitted in the correct format, i.e., STxxx.azurewebsite.net					

D. Cloud Computing basics • Discussion on the difference between cloud hosting models • Discussion on the difference between on-premises and cloud deployments	**16-20**	**11-15**	**6-10**	**0-5**	
POE Part 1 Subtotal					**/100**

© The Independent Institute of Education (Pty) Ltd 2026

Rubric 2 (for POE Part 2)					
You will be awarded marks based on how well, and completely you implemented the following:	**Excellent**	**Good**	**Developing**	**Poor**	**Comments**
A. Integrate Azure Storage • Images are now stored inside an Azure storage service **(Blob storage)** • Users can CREATE, READ, UPDATE, and DELETE events, and venues with images	**16-20**	**11-15**	**6-10**	**0-5**	

B. Implementing Error Handling and Validation
 	
• Application does not crash on common user error
  o E.g., adding a new event and leaving out a required field or leaving all fields blank.
  o Deleting an event or venue that has a booking attached.
• Users cannot double-book venues on the same date in the same venue
• Venues linked to a booking cannot be deleted
• Events linked to a booking cannot be deleted
• Alert is displayed on all validation error cases
	16-20	**11-15**	**6-10**	**0-5**	

© The Independent Institute of Education (Pty) Ltd 2026

C. Enhanced Display and Search • New Booking View created, displaying relevant information from event, venue, and booking • Search function implemented, allowing users to search by BookingID, or Event Name	**16-20**	**11-15**	**6-10**	**0-5**	
D. Azure Deployment Updates • Web app URL submitted in the correct format, i.e., **STxxx.azurewebsite.net,** and displays updated features • Submitted application contains updated codebase • Screenshot of newly created View shows in the Query editor	**16-20**	**11-15**	**6-10**	**0-5**	
E. Database Design, Cognitive Search • Comparison of Azure Cognitive Search to traditional search engines. • Discussion on database normalization importance in cloud-based design	**16-20**	**11-15**	**6-10**	**0-5**	
POE Part 2 Subtotal					**/100**
